Submitted (FEB-1999) to the EMBL/Genbank/DDBJ databases.
-!- FUNCTION: THIS ENZYME IS REQUIRED FOR ELECTRON TRANSFER FROM NADP
TO CYTOCHROME P450 IN MICROSOMES. IT CAN ALSO PROVIDE ELECTRON
TRANSFER TO HEME OXYGENASE AND CYTOCHROME B5 (BY SIMILARITY).
-!- CATALYJIC ACTIVITY: NADPH + 2 FERRICYTOCHROME - NADP(+) + 2
FERROCYTOCHROME.
                                                                                                                                                                                                                          Gaps

"Cytochrome P450foxy, a catalytically self-sufficient fatty acid
hydroxylase of the fungus Fusarium oxysporum.";
-1. Blochem. 119:435-440(1996).
-1. FUNCTION: FUNCTIONS AS A FATTY ACID MONOOXYGENASE. SHOWS HIGHEST
ACTIVITY TOWARD FATTY ACIDS WITH A CHAIN LENGTH OF 12-14 CARBONS.
THE REDUCTASE DOMAIN IS REQUIRED FOR ELECTRON TRANSFER FROM NADP
TO CYTOCHROME P450.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                 -!- COFACTOR: BINDS ONE MOLE EACH OF FAD AND FWN (BY SIMILARITY).
-!- SUBCELLULAR LOCATION: MEMBRANE-BOUND.
-!- SIMILARITY: IN THE N-TERMINAL SECTION; BELONGS TO THE CYTOCHROME
P450 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PROSITE; PROUGLE; rejou.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The specification describes a modified cytochrome P450 monooxygenase which can oxidize at least one of the following types of substrates: optionally substituted mono- or poly-cyclic aromatic heterocyclics containing nitrogen, sulphur or oxygen; optionally substituted mono- or poly-cyclic aromatics; linear or branched alkanes or alkenes; or optionally substituted cycloalkanes or cycloalkenes. The modified cytochrome P450 monooxygenase are specifically used to oxidize indole to indigo and indorublicin. However, they may be used to oxidize many

This invention describes a novel electron donor system (M1) that
transfers electrons to an enzyme with redox properties comprising an
inorganic, not electrode-bound, electron sink and a mediator which enable
the electron transfer. The invention also describes (1) transferring (M2)
oxygen to a hydrocarbon containing hydrogen donor molecule, where the
hydrogen donor molecule is in a reaction medium comprising the oxygen
transferring enzyme and (M1) in the presence of oxygen and incubating
under suitable reaction conditions; (2) the enzymatic production (M3) of
terminally or subterminally hydroxylated (position omega-1 to omega-4)
certificative in the presence of (M1) and cytochrome P450
monooxygenase; and (i1) isolating the hydroxylated product; (3) a
cold derivative in the presence of (M1) and cytochrome P450
monooxygenase; and (i1) isolating the hydroxylated fatty acids as described in (2); and (4) detecting (M4) fatty acid-monooxygenases
comprising: (1) contacting the analyte with a omega-hydroxylatable fatty

        label in (M1); and (ii) qualitatively or quantitatively detecting the signal. The invention is useful for the production of omega-hydroxylated fatty acids and the detection of fatty acid monooxygenases. The invention provides an alternative electron donor system of enzymes with redox properties that is cheaper and more efficient, where the enzyme

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    a result of site-specific mitgatemsis of its substrate-binding domain, an altered substrate profile, relative to the wild-type, when used for terminal and/or subterminal enzymatic hydroxylation of aliphatic carboxylic acids. The invention also describes (1) nucleic acid (II) encoding (I), and its complement; (2) expression cassette (EC) containing (II) and ontrol elements; (3) a vector containing at least one EC; (4) recombinant microorganisms transformed with at least one vector of (3); and (5) enzymatic production of terminally and/or subterminally hydroxylated aliphatic carboxylic acids (A) using the microorganisms of (4), or isolated (I). (I), and recombinant cells that express them, are used to produce hydroxylated aliphatic carboxylic acids (b), or isolated (I). (I), and recombinant cells that express them, are derivatives (esters and amides). (I) have altered substrate specificity, especially for hydroxylation of 8-12C fatty acids at the omega-1, -2 and/or -3 positions, and may also have increased reactivity and/or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      οŧ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Process for oxidizing acyclic or cyclic terpenes, cycloalkenes, or derivatives for preventing or treating infection in human or animal body comprises mutant haem-containing enzyme which has substitution of amino acid in the active site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The specification describes a process for oxidizing an acyclic or cyclic terpene, a cycloalkene, or a derivative. The process comprises oxidizing the compound with a mutant haem-containing enzyme which comprises a substitution of an amino acid in the active site by an amino acid with a less polar side-chain. The process is useful for oxidizing an acyclic or cyclic terpene, a cycloalkene, or their derivatives. The process is also useful for product useful for preventing or treating infection in a human or animal body. The present sequence represents the amino acid sequence of the p450-BM3 sequence. The protein is used to construct enzymes for use in the process of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 TIKEMPOPKTFGELKNLPLLNTDKPVOALMKIADELGEIFKFEAPGRVTRYLSSORLIKE

                                                                                                                                                                                                                                                              The present sequence represents a cytochrome P450 monooxygenase. The specification describes a modified cytochrome P450 monooxygenase which can oxidize at least one of the following types of substrates: optionally substituted mono- or poly-cyclic aromatic heterocyclics containing nitrogen, sulphur or oxygen, optionally substituted mono- or poly-cyclic aromatics; linear or branched alkanes or alkenes; or optionally substituted cycloalkanes or cycloalkenes. The modified cytochrome P450 monooxygenase are specifically used to oxidize indole to indigo and indorubicin. However, they may be used to oxidize many
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                KDPETGEPLDDENIRYQIITFLIAGHETTSGLLSFALYFLVKNPHVLQKAAEEAARVLVD

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     99
                                                                                                                                                                                                The present sequence represents a modified cytochrome P450 monooxygenase. The specification describes a modified cytochrome P450 monooxygenase which can oxidize at least one of the following types of substrates: optionally substituted mono- or poly-cyclic aromatic heterocyclics containing nitrogen, sulphur or oxygen; optionally substituted mono- or poly-cyclic aromatics; linear or branched alkanes or alkenes; or optionally substituted cycloalkanes or cycloalkanes or alkenes; or optionally substituted cycloalkanes or cycloalkanes are specifically used to oxidize indole to indigo and indorubicin. However, they may be used to oxidise many

compounds. Also mutants of the monooxygenase enzyme with substitutions in the active site have enhanced oxidation activity. The process and the transgenic plant or animal which expresses the monooxygenase enzyme are used for detoxifying the environment polluted with the halo aromatic compounds. The present sequence is a Bacilius megaterium monooxygenase enzyme, P450BM-3, which is homologous to the monooxygenase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a process for enzymatically oxidising the halogenated aromatic compounds such as 1,2-dichlorobenzene, 1,2,4-trichlorobenzene, 3,3'-dichlorobiphenyl or 2,2',4,5,5' 5'-pentachlorobiphenyl. The process comprises treating the polluted environment with a monooxygenase enzyme. A monooxygenase enzyme, P450cam, and its physiological electron transfer partners, putidaredoxin and putidaredoxin reductase, are used to oxidise the halogenated aromatic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a modified cytochrome P450 monooxygenase. The specification describes a modified cytochrome P450 monooxygenase which can oxidize at least one of the following types of substrates: optionally substituted mono- or poly-cyclic aromatic heterocyclics containing nitrogen, sulphur or oxygen; optionally substituted mono- or poly-cyclic aromatics; linear or branched alkanes or alkenes; or optionally substituted cycloalkanes or cycloalkenes or cycloalkenes or cycloalkenes are specifically used to oxidize indole to indigo and indorubicin. However, they may be used to oxidize many
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               note: this sequence does not appear in the specification; it was created

The specification describes a modified cytochrome P450 monooxygenase which can oxidize at least one of the following types of substrates: optionally substituted mono- or poly-cyclic aromatic heterocyclics containing nitrogen, sulphur or oxygen; optionally substituted mono- or poly-cyclic aromatics; linear or branched alkanes or alkenes; or optionally substituted cycloalkanes or cycloalkenes. The modified cytochrome P450 monooxygenase are specifically used to oxidize indole to indigo and indorubicin. However, they may be used to oxidize many

                                                                                                                                                                                                                                                                                        The protein is a fusion of bovine adrenal cytochrome P450 17-alpha and Bacillus megaterium-derived cytochrome P450 BM-3. The fusion protein has the monoatomic oxygenation activity of the former and the reductivity supplying activity of the latter. Plasmid p(alphaBM1), containing the recombinant sequence encoding the fusion protein, is used to transform Saccharomyces cerevisiae. The transformant is designated AH22(p(alphaBM-1)) and can be used for the synthesis of
